"Investigation of Boron Oxide Density at High Temperatures by the Hydrodynamic Weighing Method"

Moscow, Teplofizika Vysokikh Temperatur, Akademiya Nauk SSSR, Vol 9, No 1, Jan-Feb 1971, pp 67-73

Abstract: The hydrodynamic weighing method consists of immersing a molybdenum sphere suspended by a thin wire from a balance into liquid boron oxide; the sphere moves up or down depending on the pull of the balance; the movement is slow due to the high viscosity of boron oxide. The velocity of this motion is plotted versus the balance pull. The equilibrium condition corresponds to zero velocity, it is used to calculate the density of the boron oxide.

The density obtained by this method in the temperature range from 850 to 2000°C is presented. The relative error is within 0.25%.

PROCEDURES FOR THE STUDY OF ECONOMIC EFFICIENCY ENSUING FROM
IMPROVEMENT OF HEALTH STATUS OF INDUSTRIAL WORKERS

V. F. Shpinin

Summary

The author underlines that for estimating economic efficiency ensuing from improved health condition of industrial workers as base materials should serve the data characterizing social-hygienic investigations of the workers' health. The procedure encompasses methods of estimating additional number of manpower required in branches of manufacturing industries creating supplementary products and the magnitude of their cost, these products being manufactured through using funds saved by reducing morbidity with temporary disability, occupational sickness rate, invalidity, mortality, prolongation of active gainful employment time, downgrading hospitalized disease cases and effective introduction into the practice of Soviet public health of results derived from research work. The article lists data pointing to the impossibility of taking account of all expenditures which would make for good health status of industrial workers and stresses the need for further research work in this domain. The paper includes 8 formulas for economic calculations and literature sources.

"Calculating Massive Foundations for Deep Laying in a Multilayered Soil Series"

Tr. VNII transp. str-va (Works of the All-Union Scientific Research Institute of Transport Construction), 1971, vyp. 78, pp 87-93 (from RZh-Mekhanika, No 11, Nov 71, Abstract No 11V620)

Translation: In the development of a procedure for calculating massive foundations of bridge supports for deep laying discussed in Appendix 25 of SN 200-62 [Construction Norms 200-62], formulas are proposed which permit calculation of foundations buried in a multilayered soil series. The formulas are based on a calculation scheme in which the foundation is considered as an infinitely rigid beam, and the soil series is considered as an elastic base characterized by the bedding coefficient which varies with depth according to an arbitrary law. In contrast to the SN 200-62 procedure, the resistance of the soil base to displacements of the footing points of the foundation not only in the vertical but also in the horizontal directions. The formulas permit determination of the displacements of the foundation, the internal stresses in its transverse (horizontal) cross sections, the normal stresses arising at the contact of the soil with the lateral surface of the foundation and also the normal and tangential stresses arising at the contact of the soil base with the foundation footing.

"Effect of Poisons on Human and Warm-Blooded Animal Cells"

Frunze, Sovetskoye Zdravookhraneniye Kirgizii, No 6, 1972, pp 33-36

Abstract: The toxic effect of DDT, lindane, sevin, and other pesticides on human embryonal fibroblasts in Hanks solution was twice as great as on the same cells cultured in a nutrient medium. For example, after 24 hours' exposure to 100 mg/kg of TMTD, the index of cell degeneration (difference between the number of degenerated cells in the experiment and in the control as a percentage for each exposure) in Hanks solution was 82.1% compared to 40.7% in the nutrient medium. The response of rabbit embryonal fibroblasts to the same poisons was not significantly different from that of the human cells. The experimental results tend to confirm the author's assumption that individual human and warm-blooded animal cells are twice as sensitive to toxic agents as the integral organism.

"Toxicological Evaluation of the Effects of DDT, Hexachlorocyclohexane,
Tetramethylthiuram Disulfide, Sevin, and Zineb on Human Cell Cultures"

Moscow, Gigiyena Truda i Professional'nyye Zabolevaniya, No 3, 1973, pp 32-35

Abstract: DDT, HCH, TMTD, sevin, and zineb applied to cultures of human embryonal fibroblasts, transplantable amnion cells, and Detroit cell strains had dose-dependent antimitotic action, injury occurring in the interphase or preprophase and telophase. The cytotoxic effect of the pesticides was particularly pronounced after 48 to 96 hours and it gradually increased toward the end of the experiment. The carbamates (TMTD, sevin, zineb) had a stronger cytotoxic and cytostatic effect than the organochlorine pesticides (DDT, HCH). The cytotoxic effect was achieved with doses one-half to one-fourth the permissible residual amounts (per kg of human weight). A cell culture as a test object for toxic agents is more sensitive than the integral organism because of the latter's antitoxic barriers and mechanisms of detoxification.

"Cytotoxicity of Combination of Pesticides"

Moscow, Voprosy Pitaniya, No 1, 1973, pp 44-47

Abstract: The organochlorine pesticides most widely used in Kirghizia -- metaphos, methylmercaptophos, chlorophos, phosphamide, sevin, DDT, and lindane -- were isolated from food products of animal and plant origin, tobacco, water, air, mother's milk, and fatty tissue at or below the maximum permissible levels. In experiments with human embryonal fibroblasts in vitro the addition of the individual chemical agents to the cultures in amounts actually present in people in Kirghizia had little cytotoxic effect (judged by the number of degenerated cells) compared to the control. However, the effect was pronounced when a mixture of all the pesticides was added. The authors caution that the results of in vitro experiments cannot be compared to the effects in vivo because of the antitoxic barriers and mechanisms of detoxification that function in the intact organism.

"The Effect of Some Pesticides on Immunological Reactivity"

Moscow, Gigiyena i Sanitariya, No 12, 1971, pp 29-33

Abstract: Various immunological indexes (agglutinin titers, phagocytosis, peripheral blood, cholinesterase activity, skin test with morphine, protein spectrum, changes in weight, and so forth) were studied dynamically in rabbits and mice poisoned with DDT, TMTD (tetrathion), sevin, or zineb daily for 6 months. Three doses were used: (i) permissible residual amount or dose insufficient to elicit changes, (ii) dose sufficient to detect physiological and biochemical changes, and (iii) toxic dose. Immunobiological reactivity proved to be a fairly sensitive indicator of the effect of pesticides. Changes occurred even after permissible residual amounts, although they were not persistent. After a brief and slight decrease or increase in reactivity, there was a tendency toward normalization. Doses sufficient to cause initial toxic symptoms resulted in decreased phagocytosis of leukocytes and sharp reduction in antibody titers and immunogenic properties of blood serum. Large (toxic) doses usually caused early decompensation and 1/2

USSR

PERELYGIN, V. M., et al., Gigiyena i Sanitariya, No 12, 1971, pp 29-33

immunological reactivity diminished steadily. These changes preceded the appearance of symptoms of specific pathology. The agglutinin titer, protective serum antibodies, leukocytic phagocytosis, and skin test with morphine are the most sensitive indexes of immunological reactivity.

"Antimitotic Action of Toxic Chemicals on Human Cells in Tissue Culture"
Frunze, Sovetskoye Zdravookhraneniye Kirgizii, No 6, 1970, pp 43-45

Abstract: The effect of various doses of DDT, hexachlorocyclohexane, TMTD, sevin, and zineb on mitosis were studied in cultures of human embryo fibroblasts, human amnionic cells, and strains of Detroit cells (obtained from malignant bone marrow cells). All the compounds blocked mitosis in interphase and telophase. The carbamates (especially sevin and zineb) were twice as potent as the organochlorine pesticides. The antimitotic effect of a chemical was directly related to the concentration used. There were no significant differences among the various tissue cultures in their response to the chemicals.

"Semiconductor Diodes For Control Of Microwave Power"

Radiotekhnika, Vol 27, No 5, May 1972, pp 9-24

Abstract: The paper discusses the thermal and electrical effects in switching and limiter diodes at high and low levels of microwave power, the system of parameters of the diodes, and the methods for their measurement. The principal statements of the theory of devices for control of microwave power are discussed. Planning of one- and multichannel regulator units based on switching and limiter devices is described. It is concluded that use of switching and limiter diodes in microwave technology makes it possible to reduce the dimensions and weight of apparatus, to increase its speed of response, to reduce the power with respect to control goals, and to increase the reliability. 15 fig. 22 ref. "Microwave Band Limiter Diodes"

V sb. Poluprovodn. pribory i ikh primeneniye (Semiconductor Devices And Their Application--Collection Of Works), No 23, Moscow, "Sov.radio," 1970, pp 64-81 (from RZh--Elektronika i yeye primeneniye, No 12, December 1970, Abstract No 12B150)

Translation: A new semiconductor devices is described--a microwave band semiconductor limiter diode, which is essentially an analog of a microwave discharger. The semiconductor diode is characterized by the following parameters: at a low power level, the capacitance amounts to 0.7--3.4 pf (3 groups), the resistance 5--15 ohm; at a high power level the resistance is < 0.5 ohm; the limiting threshold is on the order of a milliwatt, thermal resistance is < 100 deg/watt, recovery time is < 200 nanosec, transient time is < 1 nanosec. During operation in the decimeter band with 1 kw power the limiting device assures blocking losses on the order of 30 db and with power < 1 milliwatt, the gating losses amount to approximately 0.5 db. It is possible to develop a microwave power regulator on the basis of the limiting semiconductor diode. 7 ill. 20 ref.

Translation: The method of computation is discussed for the thermal processes in a semiconductor diode with a mesa structure, taking into account the heat removal from the p-n junction at both sides during continuous and pulse regimes. A method is described for measurement of the instantaneous values of the temperature of a p-n junction in the course of its heating and cooling. It is shown that the thermal resistance of a limiter semiconductor diode amounts to ~ 75 degree/watt, and within wide limits its pulse thermal resistance is described by the formula

$$R_{t1} = 3 \cdot 10^3 \sqrt{t_1},$$

where t_1 is the pulse duration of microwave power in seconds (for a semiconductor diode with a 100 micrometer diameter of the mesa structure). The experimentally determined dependence of the p-n junction temperature of a limiter microwave diode on the pulse duration agrees satisfactorily with the computations. 5 ill. 1 tab. 6 ref. Summary.

"Alloys With A Niobium Base for Elastic Sensing Elements"

Moscow, Tsvetnyye Metally, No 7, Jul 70, pp 61-62

Abstract: The purpose of the experiments described by this article was to develop alloys which can be used as elastic sensing elements at temperatures above 500-550°, the present-day limit. Taking up where an earlier article left off (Yeliseyev, S. A., et al, Tsvetnyye metally, No. 12, 1968) the authors processed two alloys consisting of various proportions of refractory elements Mo, Zr, Ti, Cr, C, Nb, and N+O. The proportions of the last two were the same in both cases, the proportion of Nb being standard. The alloys were given two smeltings in a vacuum electric-arc furnace with soluble electrodes, and the ingots were given hot and cold deformations for conversion into sheets 0.3 mm thick. Investigating the effect of thermal processing on these sheets, the authors found that they could get effective hardening by a vacuum procedure consisting of tempering in oil and subse-

1/2

USSR

YELISEYEV, S. A., et al., Tsvetnyye Metally, No 7, Jul 70, pp 61-62

quent aging. From their experiments, the authors concluded that the alloys can be toughened, with niobium as the basis, through vacuum processing with tempering in the 1400-1800° C range, and aging at 950-1050° C. They found also that they can develop alloys that can work as elastic sensing elements at temperatures of 800°.

**PHLEBOGRAPHY IN DISEASES OF THE VENOUS SYSTEM
OF THE LOWER EXTREMITIES**

Ya. I. Shpungin

Transcalfaneal phlebography was performed in 54 patients with different diseases of the venous system of the lower extremities. Phlebography, carried out with a 50 per cent diodone in inclined position of the patient, enabled to obtain complete contrast filling of the entire venous system of the lower extremities. Phlebography of deep veins in postphlebotic syndrome is characterized by destructive changes of veins and valves as the result of sustained thrombosis and helps to elucidate the degree of recanalization. In varicose ulcers of the shin phlebography defines the localization of dilated communicating veins, thus creating conditions for their ligation during the operation.

"Thermodynamic Equilibrium Constants and Thermal Effects of the Extraction Reactions of Uranyl Nitrate, With Use of Trialkylphosphates in Inert Solvents: III. Tri-N-Propylphosphate (TPPh)"

Leningrad, Radiokhimiya, Vol XIII, No 3, 1971, pp 463-466

Abstract: Synthesized tripropylphosphate (TPPh) in the forms $\text{UO}_2(\text{NO}_3)_4 \cdot 2\text{TPPh}$ and $\text{UO}_2(\text{NO}_3)_2 \cdot 2\text{TPPh}$ was studied spectrometrically. The structure of the two solvates was found to be identical. X-ray analysis showed that for the compound $\text{UO}_2(\text{NO}_3)_2 \cdot 2\text{TPPh}$, the phosphate molecules are in the trans-position, while the NO_3^- group has a coordination capacity of 2. Also determined were the distributions of TPPh between aqueous solutions and carbon tetrachloride and n-dekane at 10-50°C, and the concentrations of TPPh in a 0.08-0.15 M organic phase. Thermodynamic equilibrium constants for the same solution and temperatures were determined. On the basis of the relationship of the constant with temperature, the functions of the extraction reaction ΔH (cal/mole), ΔS (cal/deg·mole) and ΔG (cal/mole), were determined for $t = 25^\circ\text{C}$.

"Thermodynamic Equilibrium Constants and Thermal Effects of the Extraction Reactions of Uranyl Nitrite with Use of Trialkylphosphates in Inert Solutions: I. Tri-N-Butylphosphate (TBPh)"

Leningrad, Radiokhimiya, Vol XIII, No 3, 1971, pp 380-385

Abstract: Various parameters in addition to bond energy exert a substantial effect on the equilibrium of chemical reactions; these include mass, size, symmetry, and others. Owing to the complexity of this problem, a simplified approach was applied here in the study of such parameters. The structure of the solvate $\text{UO}_2(\text{NO}_3)_2 \cdot 2\text{TBPh}$ was determined, along with the thermodynamic equilibrium constants of the extraction reactions for tri-n-butylphosphate in carbon tetrachloride and in n-dekane, at temperatures of 10-15°C. The thermodynamic extraction functions ΔH , ΔG and ΔS , at $t = 25^\circ\text{C}$ were also determined.

"Information Measure of Determinacy and Its Use in Identification of Objects of Control"

Tr. 1 Vses. simpoziuma po statist. probl. v tekhn. kibernet. Identifik i apparatura dlya statist. issled. (Works of the First All-Union Symposium on Statistical Problems in Technical Cybernetics. Identification and Equipment for Statistical Investigation), Moscow, "Nauka", 1970, pp 126-136 (from RZh-Matematika, No 10, Oct 70, Abstract No 10V109)

Translation: The problem of quantitatively evaluating the degree of isomorphism of the mathematical model of an object-original is discussed. The quantitative estimate of the degree of isomorphism proposed, the information measure of determinacy, is based on the fundamental notions of information theory. Let a random quantity X "act" on the input of a one-dimensional inertialess object and the random quantity Y "act" on the output. A certain distribution of the values of Y corresponds to each fixed X . In this case it is proposed that the following quantity be used as a relative information measure of determinacy:

1/2

USSR

RAYBMAN, N. S., et al, Tr. 1 Vses. simpoziuma po statist. probl. v tekhn. kibernet. Identifik i apparatura dlya statist. issled., Moscow, "Nauka", 1970, pp 126-136

$$q_X\{Y\} = I_X\{Y\}/H\{Y\}, \quad (1)$$

where $I_X\{Y\}$ is the quantity of information on Y contained in the input quantity X and $H\{Y\}$ is the unconditional entropy of the quantity Y . Calculation of the information measure of determinacy by formula (1) involves a large number of calculations in practice. It is shown in the work that under certain constraints on the unconditional and conditional probability density of the quantity Y it is possible to express the information measure of determinacy in terms of more simple characteristics of the object; in particular, in terms of the measure of determinacy based on dispersion methods for random quantities. Such a measure of determinacy was introduced by N. S. Raybman (Avtomatika i Telemekhanika, 1963, 24, No 9). One can similarly introduce an information measure of determinacy for static multidimensional and dynamic objects. Examples of calculating the measure are given. Yu. Shinakov.

"A Fast Photo Lens"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsey, Tovarnyye Znaki, No 6, Feb 72, Author's Certificate No 328408, Division G, filed 4 May 70, published 2 Feb 72, p 142

Translation: This Author's Certificate introduces: 1. A fast photo lens which contains four components, the first made up of two separate negative menisci with concavity facing the diaphragm, and the second made up of a double-cemented element and a separate element. As a distinguishing feature of the patent, correction of aberrations is improved with simultaneous reduction of the overall longitudinal size by equipping the first component with an additional negative meniscus with concavity facing the diaphragm, and by making the separate element of the second component in the form of a negative meniscus with concavity turned toward the diaphragm, and making the third component from cemented positive and negative menisci and a biconvex lens with a power that is 15 and 1.6 times that of the positive and negative meniscus respectively. The fourth component is cemented up from a positive and a negative meniscus with powers of the same order and a difference in the coefficients of refraction of at least 0.19 and

1/2

USSR

VOLOSOV, D. S. et al., USSR Author's Certificate No 326408

a dispersion coefficient ratio of at least 2.2. 2. A modification of this lens distinguished by the fact that a field of view of at least 90° is achieved in a liquid by making the separate and double-cemented elements of the second component as a single unit.

"Studies of Stresses in Tunnels by the Polarization Optical Method and Under Natural Conditions Under the Effect of an Explosive Load"

Sb. tr. Mosk. inzh. stroit. in-t (Collected Works of the Moscow Construction Engineering Institute), 1970, No 73, pp 53-63 (from RZh-Mekhanika, No 11, Nov 70, Abstract No 11V834)

Translation: The stressed state of the hydrotechnical tunnels of the Toktogul GES / Hydroelectric Power Plant 7 and the Alma-Ata siltproof dam occurring when exploding charges during their construction was investigated in two-dimensional models. The scales of geometric similarity were $(2.5-6) \cdot 10^3$. The complex shape of the day surface led to multiple application of the incident and reflected waves. The stresses in the outline of the tunnels were determined by pictures of the interference bands from the condition of similarity of the wave field in nature and in the model using known theoretical and empirical relations.

1/2

STRELCHUK, N. A., et al, Sb. tr. Mosk. inzh. stroit. in-t, 1970,
No 73, pp 53-63

The problem was solved under the assumption of elasticity anisotropy of the material in nature (limestone) and the model (ED5-MTGFA). For the characteristic times corresponding to the effect of different waves in the tunnel, stress-strain diagrams of the expected maximum outline stresses are presented. A comparison of the results obtained using the model and natural measurements is presented for the Alma-Ata Dam. The bibliography has 9 entries.

"Ignition of a Cylindrical Channel of Condensed Material in a Semiclosed Volume"

Novosibirsk, Fizika Goreniya i Vzryva, Vol. 6, No. 3, Sep 70, pp. 311-317

Abstract: A simple statement of the problem of the variation of pressure in a channel of condensed medium burning stably in a semiclosed volume is studied. It is assumed that only a comparatively small portion of the condensed material is ignited. The subsequent combustion process is limited primarily by propagation of the flame along the material. Graphs are presented showing the change in pressure, local speed of sound and local flow rate.

Leningrad, Vestnik Khirurgii imeni I. I. Grekova, Vol 106, No 5, May 71,
pp 61-64

Abstract: Hemostatics prepared on the basis of oxidized cellulose by methods developed by workers at the Khar'kov Chemico pharmaceutical Institute (B. G. Yasnitskiy, Ye. B. Dol'berg, V. A. Ozidoroga, A. A. Shalimov, V. N. Polupan, A. A. Shinkarenko, and M. I. Shrigo) were subjected since 1965 to experimental and clinical tests at the Khar'kov Scientific Research Institute of General and Emergency Surgery. After experimental tests on animals, the hemostatics were applied clinically at the Institute of General and Emergency Surgery under the direction of Prof. A. A. Shalimov, Corresponding Member of the Academy of Sciences Ukrainian SSR, Director of the Institute. Hemostatic gauze, hemostatic viscose fabric, and the hemostatic composition Oxycellodex (hemostatic gauze powder + 20% of a dextran solution with a mol. wt. of 45,000-70,000) were applied successfully on patients. The gauze and viscose fabric were used to stop the blood flow from small blood vessels after major

USSR

SHRAGO, M. I., et al., Vestnik Khirurgii imeni I. I. Grekova, Vol 106, No 5, May 71, pp 61-64

operations. An advantage of these hemostatics was that they did not have to be removed from the wound, because they were resorbed. Gxycellodex was injected with a syringe to fill the channels left after transcutaneous puncture biopsy of the liver of splenic portography. The hemostatic gauze is being produced at the experimental plant of the Khar'kov Chemico pharmaceutical Institute. Preparations for the production of the hemostatic viscose fabric at this plant have been made.

"Sorption of Hydrogen Fluoride by AB-17 x 8 Anion-Exchange Resin from the Gas Phase"

Ivanovo, Izvestiya vysshikh uchebnykh zavedeniy, khimiya i khimicheskaya tekhnologiya, Vol XV, No 7, 1972, pp 1112-1114.

Abstract: A study was made of the sorption of HF by AB-17 x 8 anion-exchange resin from wet gases under laboratory conditions to obtain a mathematical description of the process. The Hartley plan with a nucleus quarter-replica type 2^{6-2} was used. The experiments were performed under dynamic conditions with the following independent variables: x_1 -- $\log C_{HF}$ where C_{HF} is the initial HF concentration in the gas, mg/l; x_2 -- experimental temperature, °C; x_3 -- moisture of the gas, %; x_4 -- gas velocity, m/sec; x_5 -- $\log d$ where d is the grain diameter of the ion-exchange resin in the tested fraction, mm; x_6 -- height of the ion-exchange resin layer, mm. The coding conditions and experimental matrix are presented in table form. The regression coefficients were calculated on a computer and the Student criterion was used to eliminate some of them. The regression equation obtained agrees with the $1/2$

"Concerning Some Particulars of the Interaction of High-Energy Electrons and Positrons With Crystals"

Kiev, Ukrainskiy Fizicheskiy Zhurnal, Vol 16, No 9, Sep 71, pp 1548-1550

Abstract: The total yield of electron and positron bremsstrahlung is studied as a function of crystal orientation when the primary beam is nearly parallel to the crystal axis. The electron and positron beams were characterized by the following data: the energy at the maximum of the spectra was (1000 ± 5) MeV; the width of the energy spectra in both instances was $\sim 4\%$; there was no more than 8% difference between the average currents of the electron and positron beams; the difference in angular divergences of the beams was no more than $5 \cdot 10^{-5}$ radian; the number of charged background particles did not exceed 0.05% of the number of electrons and positrons respectively. The experiment was done on the

1/2

USSR

GRISHAYEV, I. A. et al., Ukrainskiy Fizicheskiy Zhurnal, Vol 16, No 9, Sep 71, pp 1548-1550

accelerator at the Physicotechnical Institute of the Academy of Sciences of the UkrSSR. The background due to positron converter photons was 30% of the measured total photon yield and varied by 0.5% during the experiment. Silicon crystals 0.64 mm thick cut in plane (110) and niobium crystals 1 mm thick cut in plane (100) served as the specimens. The strongest distinguishing parameter on the curves plotted for bremsstrahlung yields as related to crystal orientation was the width of the minimum in the small-angle region, which was less for positrons than for electrons in both instances. Controlled experiments seem to indicate that this effect can be attributed to the sign of the charge. The authors thank V. M. Kobezskiy, V. I. Myakota, and V. I. Popenko for maintaining stable accelerator operation; V. I. Artemov for assisting with measurement of beam parameters; and Ye. A. Levikov for assisting with preparation of the crystals. "Design and Determination of Characteristics of Analytic, Self-Adjusting Systems With Standard Models"

Moscow, 270 pp, 1972, "Mashinostroyeniye," p 2

Translation: This book is devoted to automatic control systems with self-adjusting parameters, calculated by the gradient method with the use of auxiliary operators. Systems of this type are classified, their purposes and advantages are considered, and the theory and results of research into some of the systems' characteristics and different examples of the computation and design are given.

A great deal of attention has been devoted to an explanation of the method of equivalent self-adjusting circuits, developed by the authors, through which the computations of analytic self-adjusting systems with standard models necessary for design can be made with sufficient ease by methods known from control theory.

The book is aimed at engineers and scientific-technical personnel working with self-adjusting automatic control systems. Six tables, 91 illustrations, bibliography of 43 titles.

"Design of Quadrature Converter Circuits With Semiconductor Rectifiers"

V sb. Vopr. uluchsheniya tekhn. parametrov vypplyamit. i tranzist. priborov (Problems of Improving the Technical Parameters of Rectifiers and Transistorized Devices--collection of works) Leningrad, 1970, pp 11-20 (from RZh-Radiotekhnika, No. 3, March 71, Abstract No. 3A348)

Translation: This article indicates the importance of reducing the effect of the shape of the measurable voltage or current curve on the indications of the rectifier system instruments. A method is considered for synthesizing approximately quadrature rectifier circuits based on the use of a piecewise linear approximation of a quadratic function. This is realized through a semiconductor diode operating in a situation of large loads and having successively switched-in additional resistors. Circuits of quadrature converters with stabilitrons are given, and a graph of the error of a quadrature circuit (synthesized by the method of tangents) is shown. Bibliography of six. E. L.

"The Reliability of Relay-Contact Circuits"

Veroyatnostn. Avtomaty i ikh Primeneniye [Probabilistic Automata and Their Applications -- Collection of Works], Riga, Zinatne Press, 1971, pp 201-205, (Translated from Referativnyy Zhurnal, Kibernetika, No 10, 1971, Abstract No 10 V630 by Z. Koroleva).

Translation: Relay-contact circuits are studied, realizing symmetrical quasi-monotonic Boolean functions of n variables with indices k and l . The reliability of the operation of a circuit is defined by the number $s = \min_m s_m$, where s_m is the probability of proper action of the circuit with its input state with norm m . Suppose r_m is the probability that current will not pass through the circuit in the input state with norm m , then $s_m = 1 - r_m$ where $l \geq m \geq k$ and $s_m = r_m$ where $m > l$ or $m < k$. In this work for certain particular relationships between the numbers n, k, l, m and for $p > 2/3$ (p is the probability of proper action of one contact) it is demonstrated that $r_{m+1} < r_m$. This inequality allows the number of input states studied to be reduced in calculating the number s .

"Experimental Investigation of the Interaction of Liquid Drops"

Kiev, Gidromekhanika, No 18, 1971, pp 76—79

Abstract : The experimental investigation of the stability of a motionless big drop, the "target", by its collisions with small drops, the "shells", of different size, flying out from a rotating capillary with different speeds, is described. The experiments were carried out within the range of $12 < Re < 900$, $10^{-3} < G < 0.5$, where G is the stability criterion

$$G = \frac{\eta^2}{6g\langle\delta\rangle}$$

and η , g , and δ are the dynamic viscosity, density, and skin stress coefficient and $\langle\delta\rangle$ = average size of the target-drop. From the processing of experimental data by the method of least

"Military-Field Surgery"

Moscow, Krasnaya Zvezda, 12 May 71, p 4

Abstract: The scientific technical revolution has brought great advances in military medicine, especially in the USSR. Blood transfusion was an early advance in the treatment of wounds and shock. Methods of quick freezing blood have been developed. Specialized substances are also made from blood. Scientists are now working on a completely artificial blood substitute to perform all of the functions of blood. New antibiotics are being created. The creation of artificial organs such as kidneys is also important. An apparatus for blood circulation is being used in operations and to assist weak hearts and lungs. Metal support pins are used to reinforce broken bones. Specialists are testing a type of adhesive for bones, and ultrasonic methods have been developed. There have been great advances in the treatment of burns. Skin transplants are among the most important methods. A special instrument called a dermatom is used here. Work is also being done on trans-

planting tissues and organs. The stitching of wounds and operations is being automated. New types of local and general anesthetics, and artificial methods of maintaining breathing and blood circulation have also appeared. Electronics, especially new x-ray and television equipment, is also changing medicine.

"Variability of the Cholera Pathogen"

Moscow, Priroda, No 6, 1971, pp 43-49

Abstract: Many of the difficulties in understanding the epidemiological aspects of cholera and in controlling the infection are due to the ease with which the agent mutates. Two main processes are at work: (a) transmission of genetic material from cell to cell through conjugation and (b) transfer of genetic information from one biotype of vibrio to another by means of bacteriophages (transduction). The agent of most present-day cholera epidemics, the El Tor vibrio, is the result of transduction or lysogenic conversion of non-agglutinating cholera-like vibrios that produce hemolysin and exotoxin. It is considered that the microorganism will continue to mutate and eventually become saprophytic. This may alter the epidemic process and pathogenesis of cholera. The course of the disease will differ from that of the classical form and, instead, come to resemble that of acute gastroenteritis.

"Radiation Recombination at Repelling Centers in GaAs:Cu"

Leningrad, Fizika i tekhnika poluprovodnikov, No 10, 1972, pp 2003-2005

Abstract: In earlier papers written by the authors named above and published in the same journal (Ryvkin, S. M., et al, 5, 1971, p 1212; Kastal'skiy, A. A., et al, 5, 1971, p 1596) the characteristics of radiation recombinations of unbalanced current carriers in gallium antimonide repelling centers were considered, and it was shown that the Coulomb interaction of a recombining electron and a repelling impurity center completely determines the characteristics of the radiation center. In the present article, the authors investigate radiation recombination at centers whose charge condition is fully known, those centers existing in GaAs mixed with Cu. The specimens in these experiments had concentrations of $n = 2 \cdot 10^{15}/\text{cm}^3$ and a mobility of $\mu = 5.5 \cdot 10^3 \text{ cm}^2/\text{V} \cdot \text{sec}$ at room temperature, and the photoluminescence spectra were obtained at 77° K with the specimens under excitation from a ruby laser with modulated Q. Curves for the experimental results are given. The authors express their

"A New Process for Preparing an Aluminum-Steel Bimetal"

Moscow, Fizika i Khimiya Obrabotki Materialov, No 4, Jul/Aug 72, pp 119-122

Abstract: Friction fusing was considered as a possible preparation process for an aluminum-steel alloy. It was shown that in the zone of contact, a migrating layer was formed, the thickness of which was determined by the technological parameters of the fusion process. The most stable compound of steel with aluminum or with an aluminum alloy was obtained when the thickness of this layer was on the order of $1-3 \mu$. A reliable friction fusion system for producing these alloys is explained.

"Concerning the Structure of a Weak Shock Wave in a Gas-Liquid Medium"

Moscow, Doklady Akademii Nauk SSSR, Vol 207, No 2, 1972, pp 313-315

Abstract: Experiments were done as a qualitative check on theoretical concepts of a shock wave propagating in a liquid containing gas bubbles. The piezoelectric method of measurement was used to investigate the structure of the shock wave front. The LKh609 pressure gauge was used with frequency independence from 20 to 50 kHz and sensitivity of 6.3 V/bar. Nitrogen was blown into the liquid through a porous plate at the lower end of a transparent plastic tube 6 cm in diameter and 100 cm long. Signals from pressure gauges on the inner walls of the tube were sent to a cathode-ray oscilloscope. It was found that increasing the intensity of the shock wave increases the frequency and relative amplitude of oscillations in the shock wave front. Reducing the bubble diameter increases the frequency and reduces the ampli-

"Effect of Serotonin on the Function of the Hypothalamus-Hypophysis Adrenal Cortex System"

Moscow, Doklady Akademii Nauk SSSR, Vol. 194, No 5, 1970, pp 1237-1240

Abstract: Serotonin (2.5-10.0 micrograms) was introduced into various nuclear formations of the hypothalamus and brain ventricle of Wistar rats through a microcannula (external diameter, 0.05-0.5 mm). In other experiments, serotonin was introduced intra-abdominally in doses of 100-200 micrograms per 100 g body weight, together with its precursor 5-hydroxytryptophan (15-20 mg/100 g), which passes through the blood-brain barrier. Five-hydroxytryptophan was also given 5 days after administration of aminazine (1-2 mg/kg). Agar-agar capsules without serotonin were implanted in the brains of control animals, or 0.02 ml physiological solution (pH, 7.3-7.4) was introduced through the cannulas or intra-abdominally. The functioning of the glandular system under study was monitored by corticosterone secretion in the blood. It was found that serotonin-sensitive structures in the central hypothalamus participate in the activation

1/2

USSR

~~SHREYBERG~~, G. L., et al, Doklady Akademii Nauk SSSR, Vol. 194, No 5, 1970, pp 1237-1240

of the hypothalamus hypophysis adrenal cortex system. Implantation of serotonin in other regions of the hypothalamus produced a reduction in the activity of this system. The results of implantation of serotonin capsules in different regions of the hypothalamus and of injection of serotonin into different parts of the brain are discussed in detail. It is concluded that serotonin is endogenically synthesized in the brain from its precursor 5-hydroxytryptophan. Serotonin-sensitive neurons are assumed to exist at the primary capillaries of the portal region of the hypophysis. When they are excited, the corticotropin-promoting factor is formed and separates out.

"Procedural Criteria for the Justifiability of Estimator Parameters"

Nauch.-tekhn. inform. Sb. Vses. in-t nauch. i tekhn. inform. (Scientific and Technical Information. Collection of the All-Union Scientific and Technical Information Institute), 1971, ser. 2, No 1, pp 5-7, 35 (from RZh-Kibernetika, No 11, Nov 71, Abstract No 11V865)

Translation: The author discusses certain procedural criteria for the justifiability of estimator parameters in scientology and information theory. These criteria are based simultaneously on strictness and semantic content. The following principles are formulated: 1) limitations on the selection of estimator parameters and their change with transition from one system to another is defined by theory; 2) the theory should provide for formulation of basic meaningful quantities and the basic relations between these quantities; 3) each estimator parameter must correspond to a definite meaningful quantity in the theory (must take its meaning from the theory); 4) any choice of estimator parameters must be such as to maintain

"Thesauri in Informatics and Theoretical Semantics"

Nauch.-tekhn. Inform. sh. Vses. in-t Nauch. i Tekhn. Inform. [Scientific and Technical Information, Collection of All-Union Institute of Scientific and Technical Information], Series 2, No 3, 1971, pp 21-24, 40, (Translated from Referativnyy Zhurnal, Kibernetika, No 10, 1971, Abstract No 10 V862 by A. Doroshenko).

Translation: A review is presented of works on the problems of thesauri (T). A general definition of T as a set of sense-expressing elements (words, word combinations, etc.) in a language with fixed semantic relationships is suggested. Abstract T (AT) and specific T (ST) are differentiated. An AT is a certain system of knowledge (T of a given language, T of an individual, etc.), which changes with the development of new information. The volume of information may be completed between sufficiently similar (matched) T. ST as a realization of AT may be fixed by a graph, matrix or list. It is noted that the formal theory of relationships of similarity (tolerance) provides a convenient apparatus for description of semantic models. Tolerance relationships do not have the property of transitivity; therefore, they can describe "eroded" structures of semantic fields. Problems of study and prospects for development of T are discussed. 15 Biblio. Refs.

"Topological Language Models"

Probl. Strukt. Lingvistiki 1971 [Problems of Structural Linguistics 1971 -- Collection of Works], Moscow, Nauka Press, 1972, pp 47-67 (Translated from Referativnyy Zhurnal, Kibernetika, No 1, 1973, Abstract No 1 V900 by A. Muchnik).

Translation: At the beginning of this article, a simple neighborhood model of a language is presented. Certain facts from set-theory topology (T_0 spaces) as well as the mutual relationship of tolerance ("similarity") are illustrated and utilized in this model.

The author writes that the most important problem of mathematical linguistics consists in the construction, investigation and testing of models capable of reflecting the organization of natural languages, and that a certain (sometimes several) methods of fixation or description of various sets of texts -- "languages" -- are usually related to each such model. Noting that up to now, only methods of mathematical logic and algebra have been applied to the solution of this problem, the author mentions set theory models and configuration models of language (the works

1/2

USSR

SHREYDER, Yu. A., Probl. Strukturm. Lingvistiki 1971, Moscow, Nauka Press, 1972, pp 47-67.

of Kulagina, Gladkiy, etc.) and describes certain topological models of language.

A method is suggested for description of the syntactical structure of a language using hierarchical constructions in graphs. "In order to produce texts of a language, these texts are placed into texts of a higher rank. Structural connections are described as certain precise connections between various stages ("point-center" type) and conditions of comparability at each level."

"Dispersion of the Velocity of Sound in Aniline-Nitrobenzene Solutions"

Kratk. soobshecheniya po fiz. (Brief Communications on Physics), 1970, No 7,
pp 37-41 (from RZh-Fizika, No 12(II), Dec 70, Abstract No 12Zh805)

Translation: The dispersion of sound in an aniline-nitrobenzene solution was investigated to observe its negative value, which is possible for associated solutions. At a temperature of 20°C the velocity of hypersound at a frequency of $5.5 \cdot 10^9$ Hz was determined in terms of the displacement of the Mandelstam-Brillouin components in the spectra of the thermal scattering of light which was excited by an He-Ne laser at an angle of 90°. The velocity of ultrasound was measured at a frequency of $2.8 \cdot 10^6$ Hz. It turned out that negative dispersion is absent in the solution. V. Ye. Gordeyev.

"Influence of Dispersion Hardening on the Tendency of Welded Joints in
Chrome-Molybdenum-Vanadium Steels Toward Brittle Rupture at High Temper-
atures"

Moscow, Svarochnoye Proizvodstvo, No 12, Dec 73, pp 1-3

Abstract: This work studies the influence of dispersion hardening on
the ductility and tendency toward brittle rupture at high temperatures
of welded joints in steels types 12Kh1MF and 15Kh1MF. This study showed
the influence of dispersion hardening in heated areas on the tendency of
these alloys to local brittle ruptures during heat treatment and use in
the untempered and low-tempered states. Heat treatment with high tem-
pering increases ductility and the brittle-rupture resistance of these
alloys. To prevent brittle rupture, the holding temperature of steam
pipes during heat treatment should be at least 720° C.

CO) GAS PHASE GRAFT COPOLYMN. OF ACRYLIC ACID (I) ON POLYETHYLENE (II)
FILMS WAS STUDIED. THE COPOLYMN. WAS A 1ST ORDER REACTION WITH RESPECT
TO LIGHT INTENSITY (I) WHENEVER I IS SMALLER THAN 10 NEGATIVE PRIME8
EINSTEIN,CM PRIME2,SEC, WHEREAS AT HIGHER I THE ORDER WAS INDEPENDENT OF
I. THE ACTIVATION ENERGY (DETD. AT 30-50DEGREES) WAS 4.6 KCAL,MOLE.
THE ADVANTAGES OF THE PHOTSENSITIZED GRAFT COPOLYMN. OF I ON II FILMS
WERE POINTED OUT. THE MODIFIED II FILMS EXHIBITED HIGHER THERMAL
STABILITY AND IMPROVED PHYSICOMECH. PROPERTIES.
